                                                                                                                                                                                                                 of PRG2.

-1- SUBGNIT: Homodimer; disulfide-linked In pregnancy serum, predominantly found as a disulfide-linked 2:2 heterotetramer with the proform of PRG2.
-1- SUBCELDUAR LOCATION: Secreted.
-1- TISSUE SPECIFICITY: High levels in placenta and pregnancy serum.
-1- TISSUE SPECIFICITY: High levels in placenta and anchoring villi, and in syncytiotrophoblasts in the chorionic villi. Lower levels are found in a variety of other tissues including kidney, comyometrium, endometrium, ovaries, breast, prostate, bone marrow, colon, fibroblasts and osteoblasts.
-1- DEVELOPMENTAL STAGE: Present in serum and placenta during pregnancy; levels increase throughout pregnancy.
-1- INDUCTION: By * b-bromoadenosine-3', 5'-phosphare.
-1- INDUCTION: By * B-bromoadenosine-3', 5'-phosphare.
-1- INDUCTION: By * B-bromoadenosine-3', 5'-phosphare.
-1- FPM: There appear to be no free sulfhydryl groups.
-1- SIMILARITY: Belongs to peptidase family M43B.
Oxvig C., Haaning J., Kristensen L., Wagner J.M., Rubin I., Stigbrand T., Gleich G.J., Sottrup-Jensen L.;
"Identification of angiotensinogen and complement C3dg as novel proteins binding the proform of eosinophil major basic protein in human pregnancy serum and plasma.";
J. Baol. Chem. 270:13645-13651(1995).
-! FUNCTION: Metalloproteinase which specifically cleaves IGFBP-4 in the presence of IGF, resulting in release of bound IGF.
-!- CATALYTIC ACTIVITY: Cleavage of the 135-Met. |-Lys-136 bond in insulin-like growth factor binding protein (IGFBP)-4, and the 143-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Metal-binding; Zinc; Signal; Glycoprotein;
                                                                                                                                                                    Ser-|-Lys-144 bond in IGFBP-5.
COFACTOR: Binds 1 zinc ion per subunit (By similarity).
ENZYME REGULATION: Inhibited by complexation with the proform
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GO; GO: 0008576; C: extracellular; IDA.

"Generation and initial analysis of more than 15,000 full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note=No experimental confirmation available;
-!- TISSUE SPECIFICITY: Weakly expressed in most tissues, except in brain. Expressed at intermediate level in brain, including cerebellum; substantia nigra, hippocampus and fetal brain. Overexpressed in some head and neck cancer cell lines.
-!- SIMILARITY: Belongs to the CSMD family.
-!- SIMILARITY: Contains 14 CUB domains.
-!- GIMILARITY: Contains 26 Sushi (SCR) domains.
-!- CAUTION: Ref. 3 sequence differs from that shown due to a frameshift in position 939 that shortens the protein by 1021 residues in its N-terminus. It is unknown whether the sequence shown exists or whether Ref. 3 is right, shortening the sequence in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nagase T., Kikuno R., Ohara O.;
"Prediction of the coding sequences of unidentified human genes. XXI.
The complete sequences of 60 new cDNA clones from brain which code for

-!- PATHWAY: Plays an important role in several metabolic pathways.
-!- SUBUNIT: Homodimer (By similarity).
-!- SIMILARITY: Belongs to the triosephosphate isomerase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE=2225144; PubMed=12240834; MEDLINE=2225144; PubMed=12240834; MEDLINE=2225144; PubMed=12240834; Maramura Y., Kaneko T., Sato S., Ikeuchi M., Kawashima K., Kimura T., Kishida Y., Kiyokawa C., Kohara M., Matsumoto M., Marsumo A., Nakazaki N., Shimpo S., Sugimoto M., Takeuchi C., Yamada M., Tabata S.; "Complete genome structure of the thermosphilic cyanobacterium Thermosynechococcus elongatus BP-1.";

"Cloning of two adenosine receptor subtypes from mouse bone marrow-derived mast cells.", 152:4508-4515 (1994).
-: FUNCTION: Receptor for adenosine. The activity of this receptor is mediated by G proteins which activate adenylyl cyclase.
-: SUBCELLULAR LOCATION: Integral membrane protein.
-: SUBCELLULAR Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                           Gaps

RL J. Cell Biol. 145:605-618(1999).

CC :- FUNCTION: Binding to cells via a high affinity receptor, laminin of is thought to mediate the attachment, migration and organization of cells into tissues during embryonic development by interacting with other extracellular matrix components.

CC :- SUBUNIT: Laminin is a complex glycoprotein, consisting of three different polypeptide chains (alpha, beta, gamma), which are bound to each other by disulfide bonds into a cross-shaped molecule comprising one long and three short arms with globules at each end rang man-3 chain is a subunit of laminin-12.

CC :- SUBCELLULAR LOCATION: Extracellular.

CC :- DOMAIN: The alpha-helical domains I and II are thought to interact convict the reproductive tracts.

CC :- DOMAIN: The alpha-helical domains of structure.

CC :- SUMILARITY: Contains I laminin N-terminal domains.

CC :- SIMILARITY: Contains I laminin IV domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. "Cloning and sequencing of Pseudomonas genes encoding vanillate demethylase.";
J. Bacteriol. 17. 170:4924-4930(1988).
-!- COFACTOR: FMN (By similarity).
-!- PATHWAY: Vanillate degradation (vanillate is a key intermediate in the degradation of lignin).
-!- SIMILARITY: Belongs to the PDR/vanB family.
-!- SIMILARITY: In the C-terminal section; belongs to the 2Fe2S plant-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pfenn; PP00175; NAD binding 1; 1.

gene structure, a common polymorphism, and a high prevalence of antiphospholipid antibodies.";

Hum. Genet. 109:63-72(2001).

-!- FUNCTION: Binds to various kinds of negatively charged substances such as heparin, phospholipids, and dextran sulfate. May prevent activation of the intrinsic blood coagulation cascade by binding to phospholipids on the surface of damaged cells.

-!- SUBCELLULAR LOCATION: Secreted (By similarity).

-!- TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma.

-!- SIMILARITY: Contains 4 Sushi (SCR) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine = (5-deoxy-5-adenosyl) (3-aminopropyl) methylsulfonium salt + CO(2).
-!- COFACTOR: Pyruvoyl group.
-!- PATHMAY: Decarboxylation of S-adenosylmethionine provides the aminopropyl moiety required for spermidine and spermine biosynthesis from putrescine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (BY

Biochemistry 29:62440-6244 [1990].

-i. FUNCTION: Could be involved in defense against microbial infections. Protects the epithelia from external environment.

-i. SUBCELLUIAR LOCATION: Secreted.

-i. TISSUE SPECIFICITY: Expressed and stored exclusively in mature mucous glands of the skin.

-i. PTM: Extensively 0-Glycosylated.

-i. SIMILARITY: Contains 1 VWFC domain.

-i. SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.

(LUDW-) LUDWIG INST CANCER RES.

Stacker S, Hughes RA, Achen MG,

Cendron A;

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine WPI; 2001-442248/47.

Claim 49; Page 32; 102pp; English.

residues.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis.

To cyclisation are used to interfere with anglogenesis.

To cyclisation or lymphanglogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphanglogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy.

The condition is diabetic retinopathy, psoriasis, arthropathy.

Cerebrovascular accident, post-angloplasty restenosis, head, heat or cramma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular or sequelae, hypertension induced neovascular or sequelae, hypertension induced neovascular or sequelae, hypertension induced neovascular continued neovascular continued neovascular continual has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic with at least one biological activity induced by WEGF. VEGF-C or -D and chronic inflammation, especially rheumatoid arthritis, psoriasis and

New polypeptides and polynucleotides, useful for treating diseases such as cancer, Alzheimer's disease, atherosclerosis, diseases associated with liver, comprises polypeptides and polynucleotides of open reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; Immunoglobulin superfamily protein; IgSF; Immune response; inflammatory response; cell-cell interaction; cell-surface recognition; neural disorder; immune system disorder; muscular disorder; cardiovascular disorder; gastrointestinal disorder; pulmonary disorder; cardiovascular disorder; proliferative disorder; common variable adhesion deficiency syndrome; AIDS; SCID; acquired immunodeficiency syndrome; anaemia; rheumatoid arthritis; Alzheimer; a disease; Crohn's disease; liver cancer; leukaemia; Hodgkin's lymphoma; Parkinson's disease; Huntingdon's disease; dementia; artherosclerosis; stroke; diabetes mellitus; Addison's disease; urticaria; severe combined immunodeficiency; antibody.
                                                                                                                                                                                                   The present invention provides the protein and coding sequences of human OREX, where X is any number between 1 and 132. These sequences can be used to diagnose and treat OREX related disorders, including cancer, hyperproliferative and dysproliferative disorders, including cancer, insorders, disorders related to organ transplantation or cardiovascular diseases, and may have cell proliferation or differentiation, cyrokine, immunomodulatory, haematopoiesis regulating, tissue growth, inhibin or activin, chemotactic or chemokinetic, haemostatic or thrombolytic and/or antinflammatory activities. The present sequence is one of the OREX

The sequence is a Human Immunoglobulin superfamily, IgSF, protein, a diverse family of proteins involved in cell-cell interactions, cell-cautherse family of proteins involved in cell-cell interactions, cell-cauther sequence in the companies. Companies of surface to the present invention are useful to provide immunological polypeptides of the present invention are useful to provide immunological probes for differential identification of tissues. Antibodies can be used to assay levels of polypeptides encoded by polynucleotides of the invention. Polypeptides of the present invention can be used to treat or prevent diseases or conditions such as neural disorders, immune system disorders, pulmonary disorders, reproductive disorders, and/or cancerous diseases and disorders, proliferative disorders, and/or cancerous diseases and conditions. Polynucleotides of the invention are also useful in treating the above disorders. Examples of the disorders include common variable adhesion deficiency syndrome, acquired immunodeficiency syndrome (AIDS), conduitions, relevance in the invention are also useful in treating anemia, rheumatoid arthritis, Alzheimer's disease, Crohn's disease, Cliver cancer, leukaemia, Hodgin's lymphoma, parkinson's disease, dementia, artherosclerosis, stroke, diabetes conduition, and assay and an emiliar, and are seamples of diseases and disorders are given in the continuation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

(CURA-) CURAGEN CORP.

Щ ., Fernandes Vernet C, Shimkets RA, Lichenstein H,

WPI; 2001-648134/74. N-PSDB; AAF87127. Novel human polypeptides and the nucleic acids that encode them useful for preventing, diagnosing and treating e.g. cancer, inflammation and for preventing, di immune disorders.

Claim 1; Page 50-52; 141pp; English.

NOV16 proteins, and their coding sequences. The proteins have Cytostatic; contraceptive; antiinflammatory; immunomodulatory; and cardiovascular (e.g. Peutz-Jeghers syndrome, cellular proliferation and contraception) MOV2-3, NOV6 and NOV9 are homologous to the epidermal growth factor (EGP) like Super family and are involved in, e.g. regulation of cell development, apoptosis, cell addresion, growth migration, cell structure and motility and protein management, and are used to treat cancers, inflammatory disorders, immune disorders and cellular adhesion disorders. serine/threonine kinases, and are used to treat kinase-related disorders This sequence is the NOV16 protein. The invention relates to the NOV1-NOV6-10 are homologous to EGF-like fibrillin proteins and are used to treat cardiovascular disease e.g. hypertrophic cardiomyopathy, long-QT syndrome and marfan syndrome

(e.g. Peutz-Jeghers syndrome, cellular proliferation and contraception). NOV2-3, NOV6 and NOV8 are homologous to the epidermal growth factor (BGF) NOV2-3, NOV6 and NOV8 are homologous to the epidermal growth factor (BGF) development, apoptosie, cell adhesion, growth migration, cell structure and motility and protein management, and are used to treat cancers, inflammatory disorders, immune disorders and cellular adhesion disorders. NOV6-10 are homologous to BGF-like fibrillin proteins and are used to treat cardiovascular disease e.g. hypertrophic cardiomyopathy, long-OT

syndrome and marfan syndrome

This sequence is the NOV15 protein. The invention relates to the NOV1NOV16 proteins, and their coding sequences. The proteins have Cytostatic;
Contraceptive; antiinflammatory; immunodulatory; and cardiovascular
activities. The sequences may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate NOVX expression. They
crecifying mutations or deletions in a patient's genome that affect the
activity of protein by expressing inactive proteins or to supplement the
patients own production of protein. They are used to produce NOVX
proteins, by inserting the nucleic acid into a cell and culturing it to
express the protein. The DNA may be used as DNA probes in assays to
detect and quantitate the presence of similar DNAs in samples, and which
cas antigens in the production of antibodies (Abs) against NOVX and in
cas antigens in the production of antibodies (Abs) against NOVX and in
assays to identify modulators of NOVX expression and activity. The anti-

NOVX Abs and antegonist are used to down regulate expression and activity. The anti-NoVX Abs are used for detecting the presence of NOVX in samples. Disorders that may be prevented, diagnosed and/or treated vary depending on the NOVX protein. NOV1, NOV3, NOV7, NOV9-11 and NOV13-16 have casein kinase II phosphorylation sites characteristic of serine/threonine kinases, and are used to treat kinase-related disorders

```
The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR) like nucleic acid molecule. The C3b/C4b CR-like polypeptide and nucleic acid molecules may be used to treat, prevent, ameliorate, diagnose and/or detect diseases such as immune system disorders such as rheumatoid arthritis, pillammatory joint disease, autoimmune arthritis, inflammatory joint disease, autoimmune arthritis, inflammatory boint disease, unlippe sclerosis, lupus, inflammatory bowel disease, transplant rejection, nervous system disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. obssity and disease) and infertility. The invention is useful in gene therapy. The present sequence is human C3b/C4b complement receptor like protein. Note: The present sequence is stated to be the same as that referred to as SEQ the sequences differ at position 695 the specification. However
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, C3b/C4b complement receptor-like molecule; immune system disorder; gene therapy; rheumatoid arthritis; psoriatic arthritis; osteoarthritis; inflammatory inflammatory joint disease; Alzheimer's disease; multiple sclerosis; inflammatory bowel disease; nervous system disorder; transplant rejection; autoimmune disease; ischaemic condition; nootropic; metabolic disorder; immunomodulatory; neuroprotective; diabetes; lupus; infertility; vasodilator; obesity; cardiant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human C3b/C4b complement receptor like protein #1, alternative version.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR)-like nucleic acid molecule. The C3b/C4b CR-like Dolypeptide and nucleic acid molecules may be used to treat, prevent, ameliorate, diagnose and/or detect diseases such as immune system disorders such as rheumatoid arthritis, psoriatic arthritis, inflammatory arthritis, psoriatic arthritis, inflammatory disease, autoimmune conferes, lupus, inflammatory bowel disease, cransplant rejection, nervous system disorders (e.g. Alzheimer's disease) ischaemic conditions, metabolic disorders (e.g. Alzheimer's chabetes) and infertility. The invention is useful in gene therapy. The present sequence is human C3b/C4b complement receptor like protein, alternative version. Note: The present sequence is stated to be the same cas that referred to as SEQ ID NO:2 (AABE20787) shown in figure 1 of the specification. However the sequences differ at position 695
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

```
The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR)-like nucleic acid molecule. The C3b/C4b CR-like polypeptide and nucleic acid molecules may be used to treat, prevent, ameniorate, diagnose and/or detect diseases such as immune system disorders such as rheumatoid arthritis, psoriatic arthritis, inflammatory arthritis, osteoarthritis, inflammatory joint disease, autoimmune disease, multiple sclerosis, lugus, inflammatory bowel disease, transplant rejection, nervous system disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. obesity and diabetes) and infertility. The invention is useful in gene therapy. The present sequence is rat C3b/C4b complement receptor like protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, C3b/C4b complement receptor-like molecule; immune system disorder; gene therapy; rheumatoid arthritis; psoriatic arthritis; osteoarthritis; inflammatory arthritis; inflammatory joint disease; Alzheimer's disease; multiple sclerosis; inflammatory bowel disease; nervous system disease; transplant rejection; autoimmune disease; ischaemic condition; nootropic; metabolic disorder; immunomodularory; neuroprotective; diabetes; lupus; infertility; vasodilator; obesity; cardiant.
                                                                                                           Nucleic acid encoding a novel C1b/C4b Complement Receptor-like nucleic acid molecule, useful for treating, preventing and diagnosing rheumatoid arthritis, psioriatic arthritis, inflammatory arthritis, and multiple

The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR)-like nucleic acid molecule. The C3b/C4b CR-like polypeptide and nucleic acid molecules may be used to treat, prevent, ameliorate, diagnose and/or detect diseases such as immune system disorders such as rheumatorid arthritis, psoriatic arthritis, inflammatory arthritis, posteoarthritis, inflammatory joint disease, autoimmune disease, multiple sclerosis, lupus, inflammatory bowel disease, disease, multiple sclerosis, lupus, inflammatory bowel disease, disease), ischaemic conditions, metabolic disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. obesity and diabetes) and infertility. The invention is useful in gene therapy. The present sequence is stated to be the same as that referred to as SEQ ID NO:7 (AAE20901) shown in page 239-251 of the specification. However the sequences differ at position 726
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, C3b/C4b complement receptor-like molecule; immune system disorder; gene therapy; rheumatoid arthritis; psoriatic arthritis; osteoarthritis; inflammatory arthritis; inflammatory joint disease; Alzheimer's disease; multiple solerosis; inflammatory bowel disease; nervous system disorder; transplant rejection; autoimmune disease; ischaemic condition; nootropic; metabolic disorder; immunomodulatory; neuroprotective; diabetes; lupus; infertility; vasodilator; obesity; cardiant.
                                                                                                                                                                   Nucleic acid encoding a novel C3b/C4b Complement Receptor-like nucleic acid molecule, useful for treating, preventing and diagnosing rheumatoid arthritis, psioriatic arthritis, inflammatory arthritis, and multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human C3b/C4b complement receptor like protein #2, alternative version.

The invention relates to a nucleic acid encoding a novel C3b/C4b

Complement receptor (CR)-like nucleic acid molecule. The G3b/C4b CR-like

Dolypoptide and nucleic acid molecules may be used to treat, prevent,

ameliorate, diagnose and/or detect diseases such as immune system

disorders such as rheumatoid arthritis, psoriatic arthritis, inflammatory

arthritis, osteoarthritis, inflammatory joint disease, autoimmune

clasease, multiple solerosis, lupus, inflammatory bowel disease,

transplant rejection, nervous system disorders (e.g. Alzheimer's

clasease), ischaemic conditions, metabolic disorders (e.g. Alzheimer's

disease), ischaemic conditions, metabolic disorders (e.g. Abcheimer's

clabetes, and infertility. The invention is useful in gene therapy. The

present sequence is human C3b/C4b complement receptor like protein,

alternative version. Note: The present sequence is stated to be the same

cc as that referred to as SEQ ID NO:7 (AAE20789) shown in figure 2 of the

specification. However the sequences differ at position 726
                                                                                                                                                                                                                                                                                                                                                           Nucleic acid encoding a novel C3b/C4b Complement Receptor-like nucleic acid molecule, useful for treating, preventing and diagnosing rheumatoid acid missing psioriatic arthritis, inflammatory arthritis, and multiple

Claim 1; Page 13-14; 299pp; English.

The present invention relates to new NOVX polypeptides. The polypeptides, polymucleotides and antibodies are useful in the manufacture of a medicament for treating or preventing neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease, or Huntington's disease; (e.g. Alzheimer's disease).

Alzheimer's disease, Parkinson's disease (e.g. acute heart failure, comencal retardation), cardiovascular disease (e.g. acute heart failure, compania pectoris or myocadial infarction), muscular diseases and diseases including those involving photoreception, definess and keratinisation disorders), cancer (e.g. ovarian cancer or melanoma), immunological disorders, inflammatory and immune diseases, bacterial, fungal, protozal and viral infections, and reproductive or expression, cardios or compounds that modulate the NOVX protein activity or expression, as well as to treat disorders characterised by insufficient or excessive production of NOVX protein forms that have decreased or aberrant activity compared to NOVX wild type protein, such as diabetes, obesity, metabolic disturbances associated with chronic diseases and various cancers, infections diseases and various dyslipidaemias. The nucleic acid sequences of the invention may be used in chromosome mapping, identifying an individual from minute biological samples (tissue typing), and in forensic identification of a biological sample. The present amino acid sequence represents a NOVX protein of the invention Sequence 95 AA;

```
Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by 2. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervolved in binding apprenties. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies of precipit for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and characterianing P. acnes presence, for example, by diagnostic agents for determining P. acnes presence, for example, by contained in electronic format directly from WIPO at this patent did not form part of the printed specification, but was of the wipo.int/pub/published_pct_sequences

conciding a Propionibacterium acnes protein. The invention also relates to encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention and to additionally encompasses expression vectors and host cells comprising a dadditionally encompasses expression vectors and host cells comprising a polymucleotide of the invention, a immune response specific for a P. acnes polypeptide and an isolated T cell bopulation comprising T cells prepared to polypeptide and an isolated T cell bopulation comprising P. acnes polypeptides, via this method; a vaccine composition (comprising P. acnes polypeptides, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient, and a method for inhibiting the development of P. acnes in a patient, and a method for inhibiting the development of P. acnes in compression, or continuous or antigen-presenting cells that express the polypeptides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the colypeptides are useful for diagnosing, preventing or treating acnes of protein. The populations or antigen-presenting cells that express the colypeptides are useful for diagnosing, preventing or treating acnes or protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the estimate and the kit is useful for performing a diagnostic assay. The present canding frame) contained within the P. acnes polymucleotides of the

Human adipocyte Selected Interacting Domain (SID) prey protein #1173.

(first entry)

15-JAN-2004

ADD27716;

ADD27716 standard; protein; 368 AA.

Adipocyte; protein-protein interaction; protein complex; bait-prey complex; Selected Interacting Domain; SID; drug; drug discovery; metabolic disease; obseity; lipodystrophy; diabetes mellitus; type 2; non-insulin dependent; NIDDM; adipogenesis modulation; gene therapy; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotides encoding full-length polypeptides, e.g. secretory and/or membrane proteins, useful for developing medicines for diseases in which the gene is involved, or as target molecules for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; Anti-inflammatory; Osteopathic; Neuroprotective; Nootropic; Gene Therapy; human; secretory protein; membrane proteins; cancer; inflammatory disease; osteoporosis; neurological disease.
                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.

The invention relates to a bait-prey complex between two adipocyte polypeptides, or between two polynucleotides encoding adipocyte polypeptides. The invention also relates to Selected Interacting Domain (SID) polypeptides which interact with selected bait polypeptides; polynucleotides encoding SID polypeptides; vectors comprising SID polynucleotides recombinant host cells comprising an adipocyte polynucleotide or a SID-encoding vector; a method of selecting for a compound which modulates interactions between adipocyte polypeptides; pharmaceutical composition comprising an adipocyte modulator, or a SID-encoding vector or host cell; and a protein chip comprising adipocyte bait polypeptides. The bait-prey complexes of the invention are useful interactions between adipocyte polypeptides. The material composition that inhibits or activates protein protein contractions between adipocyte polypeptides. The modulatory compounds identified can be used in the treatment of metabolic diseases such as obesity, lipodystrophy and type 2 diabetes mellitus, and in the condulation of adipocyte SID prey polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·

Patent No. 5587311

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: CORON, Stewart Gary

APPLICANT: MOONE, Joanna Terry

APPLICANT: WILLADEN, Law Anthony York

APPLICANT: KEMP, David Harold

APPLICANT: RIBING, George Alfred

APPLICANT: RIBING, George Alfred

APPLICANT: RAND, Keith No. 558731man

TITLE OF INVENTION: DNA Encoding A Cell Membrane

TITLE OF INVENTION: Glycoprotein Of A Tick Gut

NUMBER OF SEQUENCES: 71
